Price of each product is a combination of the following parameters such as the rounding value, discount size (if any), and minimum price value.

Price rounding

This is where one can specify number of decimal places (digits after the decimal point).

It is specified as a numeric value.

This setting is applied to price calculation and product price display. This setting shows number of decimal places that you want to display.

- 0 decimal places (digits after the decimal point): 122,541 = 123;
- 2 decimal places (digits after the decimal point): 122,541 = 123.55;
- -2 decimal places (digits after the decimal point): 122,541 = 200.

Values are always rounded up.

Click blue link in order to specify number of decimal places when rounding off product price.

Additionally (price rounding for the website only)

An additional possibility was added to specify number of decimal places when rounding product price to be shown on showcase. Values are always rounded up.

This technique of rounding, unlike the one described above, provides visible rounding. It doesn't affect accuracy of order price calculation.

In practice this means that, for example, you've set rounding value to 2 (product price will be rounded to two decimal places) in the field above in order to estimate total sum more accurately when choosing several identical cheap products. However, you don't like the way price is displayed (141 or 1478 "and change", i.e. 141,89 or 1478,73). In addition, it may be difficult for a customer to work out how much he/she will have to pay for two products or what the total sum will be if he/she adds one more product to those ones that he /she has already planned to purchase.

In this case you can set rounding value to 0 in the "Display prices" field to avoid showing digits after the decimal point (it will look nicer 142 or 1479 – Values are always rounded up.) Notice that these missing digits are included in order total calculation.

Click blue dashed underlined text "Extened".

(i) Note!

"Price rounding" setting applies to both types of rounding: internal (<u>*i.e. service*</u> one used for order total calculation) and external (display on the website, on product page and storefront)

Margin percentage

This setting is visible unless "Banker" Module is enabled.

Margin percentage is automatically added when displaying product price on the website and affects by default ONLY products price of de fault trade provider. However, if there are other trade providers on your website you can use the "Banker" module to set an accurate margin either for all products of this trade provider or selected groups of products.

This setting is specified as a numerical value.

To set a margin percentage you need to click on the blue link.

Minimum margin

This setting is visible unless the "Banker" module is enabled.

If product price is small, then margin percentage will be low. A possibility to set minimum margin is also provided. Minimum margin (not the margin percentage) will be added to product price if the above-mentioned margin percentage is less than minimum margin valu. This setting is applicable for default trade provider only. Use "Banker" Module if there are other trade providers on your website.

For example, product price is 10 CNY. You've set the margin for 5%. Thus, final price with a 5% margin (10+5%) would be 10,5 CNY. Product will cost 10+10 = 20 CNY if we set the minimum margin for 10 CNY.

(i) Important!

Minimum margin for goods should be specified in CNY (or in default trade provider's currency). One can see used currency to the right of value to be modified.

List of available currencies for trade provider is available on "Currency" tab as well as in the "Currency" documentation.
