Location in admin mode: Configuration System Security

The screenshot shows the Magento 2 admin interface. On the left is a sidebar with menu items: Orders, Pricing, Promotion, Contents, Catalog, Users, Configuration (highlighted with a red box), Reports, and Plugins. The main content area has a breadcrumb trail: Configuration > System > Security. Below this is a tabbed interface with tabs for Website configuration, Orders, Delivery, Languages, Instance configuration, Letters templates, and System (highlighted with a red box). Under the System tab, there are sub-tabs for General, Security (highlighted with a yellow box), and Update. The 'General' sub-tab is active, showing settings for 'Enter captcha when sign in into admin panel' (with a 'Disable' link), 'Key protection' (set to 'Disable' with a checkmark), 'Use HTTPS' (set to 'Disable' with a checkmark), 'Google reCAPTCHA' (with a 'Disable' link), 'The public key' (empty), and 'The secret key' (empty). There are also 'Documentation' links for each feature.

## General

### Enter captcha when signing into admin panel

Captcha is an additional brute force password protection for admin panel.

Click caption with dotted line to use (or disable) this feature:

## Secure protocol HTTPS

Data protection is extremely important in some services, for example, in electronic payment systems or in online stores, therefore they use only HTTPS. This protocol is also very often used in other services that process private information, including any personal data. The presence of encrypted data transmission increases customer loyalty by ensuring that their personal data will remain secret and no one can use it for their own purposes.

### Important!

Using this protocol requires SSL certificate purchase .

## How to start using HTTPS?

1. You need to buy SSL certificate from a specialized certificate retailer first. For example, the largest seller in the world <https://www.symantec.com/ru/ru/ssl-certificates/>
2. You must install certificate on the server where your site is located after you have purchased a certificate. You can provide certificate to your hosting provider and he will do it himself.
3. It's necessary to configure HTTPS protocol in OT Box when certificate is installed on your server.

 Error will be issued stating that connection is not secure if you enable setting without installed SSL certificate. Some browsers block such sites!

Click a triangle to open drop-down list to enable protocol:

## Google reCAPTCHA

We recommend to enable Google reCAPTCHA if you want to protect your site from spam and bots. In this case your site will be monitored for suspicious activity, and captcha will be shown on website when doubt arises in the “humanity” of site visitor:

We need API key to install such captcha, therefore we go to <https://www.google.com/recaptcha/admin>. You should be registered in Google to get access to this page. You will be prompted to register your site and enter a list of domains where this particular reCAPTCHA will be used. Subdomains are automatically counted.

Note! We support only reCAPTCHA v2 (version 2) or more earlier versions. We don't support new versions.

## Register a new site

### Label

For example, domain.com: Comments page

### Domains

(one per line)

For example:  
domain.com  
domain.net  
domain.org

☒ Get alerts about this site [?](#)

Register

You will get website key and partner secret key after that:

### Site key

Use this in the HTML code your site serves to users.

6LcePAATAAAAAGPRWgx90814DTjgt5sXnNbV5WaW

### Secret key

Use this for communication between your site and Google. Be sure to keep it a secret.

6LcePAATAAAAABjXaTsy7gwcbnbaF5XgJKwjSNwT

These 2 keys will be necessary when setting up captcha in OT admin panel.

Ready. Google reCAPTCHA will track users' activity on your site now.

## Key protection

You must specify IP address of the server where your Box is located in order to protect your Personal Key (Instance Key) from illegal use, when it comes to third parties. Key will not work on another server besides yours when the setting is enabled.

Contact your system administrator or technical support of your hosting to find out your server IP address. Most often, dedicated IP address is most often paid separately (provided as a hosting service, but usually price rarely exceeds a couple of dollars a month, but there are also tariffs where server IP address is used as the main service and is included in the monthly fee).

Click a triangle to open drop-down list to enable key protection:
